

Bellhousings

HBE Bellhousings function as connection elements between IEC electric and petrol motors and hydraulic pumps. They are available for nearly all hydraulic pumps and in all sizes ex stock at short times. Users can choose between a rigid (form A) and a noise absorbing model (form B) according to VDMA 24561. The standard versions are made of aluminium, but are also available in steel and stainless steel.

For easy selection of the required bellhousing and type of coupling, the [HBE P+Calculator](#) is available free of charge.

More information and technical details on bellhousings can be found in our [product catalogues](#).
