

Quick, accurate and reliable: the P+ Calculator

P+ Calculator now available as a significantly improved online version

For more than 4000 pumps from around 150 manufacturers, IEC, US-NEMA and Japanese standard electric motors, servo motors and petrol engines, the online P+ Calculator is the perfect solution. Thanks to the intuitive user interface, the designer is able to generate the correct motor and pump combination within just a few moments.

Small changes to the input data cause an immediate recalculation and display of the desired components, without having to restart the whole selection process.

In the latest version of the redesigned online P+Calculator you have now the possibility to choose Stainless Steel bellhousings as well as Aluminium and Carbon Steel. Also, thanks to the innovation of the „ATEX“ button, the P+Calculator is able to produce the online selection of ATEX-approved combinations. Quick and easy calculations can be made by the designer for all of your applications. Specific product information and prices are already present during the design phase. The drawings are on hand in 2D or 3D format and can also be printed immediately. For transfer to your CAD system the output as a DXF or STP file is possible.

The software supports all major web browsers (Internet Explorer, Firefox, Opera or Chrome) and requires the Silverlight plugin, which is detected and installed for free automatically if not already present during the first login. As a customer of HBE you can easily get your personal account access details by using your customer account number. For all new or prospective customers of HBE the software is available free of charge after a brief registration process.
